

1 representatives from the electrical power industry. We also
2 have individuals who are either currently working in the
3 electrical power industry or have served in the electric
4 power industry on our board of trustee.

5 MR. VARMA: Okay.

6 MR. GELLERMAN: So from an organizational
7 perspective, we have input from that part of the electrical
8 industry. On the standards development level, where they're
9 interested, they come and sit at the standards development
10 process, as do the manufacturers, the consumers, the
11 insurance interests, the local authorities who care about a
12 particular standard.

13 MR. VARMA: So the process that you use enables
14 the electric power generating and transmission industry to
15 be able to have their interests protected?

16 MR. GELLERMAN: Absolutely. As several people
17 around the table have said today, an ANSI standards
18 development process requires an open and balanced process.
19 In that process, just about anybody who has an interest and
20 is willing to attend the standards development meetings and
21 review the literature that comes out, the proposed
22 requirements and the standards and provide written comments
23 back, is able to participate in the standards development
24 process in a meaningful way.

25 MR. VARMA: And is it the Underwriters

1 Laboratories and representatives from the UL that actually
2 facilitate and conduct this process for the development of
3 standards?

4 MR. GELLERMAN: That's correct.

5 MR. VARMA: Okay. And Gordon, are these standards
6 that are developed in that manner, voluntary standards or
7 are all these standards mandatory?

8 MR. GELLERMAN: In most cases, the standards are
9 voluntary standards. The demand drive for compliance with
10 standards generated by Underwriters Laboratories comes from
11 several places. It comes from the consumers. Consumers buy
12 products that meet the requirements of UL standards because
13 consumers want to buy safe electrical products.

14 Insurance interests often require that people who
15 have facilities that are insured by them, buy and install
16 only equipment that meets UL standards in their facilities.
17 They want to protect their own interests.

18 We see a lot of demand drivers. The local code
19 authorities may require that products which are built into
20 buildings in their jurisdiction meet those same safety
21 requirements. So those are voluntary standards for the most
22 part.

23 There are a few UL standards that have been turned
24 into mandatory standards. An example of that that comes to
25 the top of my mind is the standard for garage door openers.

1 If anybody's bought a recent garage door opener, you notice
2 the little electric eyes at your feet. Those electric eyes
3 are a result of some incidents that happened with children
4 getting hurt by garage door openers and gate operators.

5 When UL incorporated those requirements through
6 our standard, actually Congress passed a law requiring
7 garage door opener manufacturers to build products which
8 comply with UL325, the standard for garage door openers and
9 gate operators. So this wasn't a regulatory body going
10 through rulemaking. This was actually an act of Congress.

11 There are other cases where we see a regulatory
12 approach to it. The CPSC, in some cases, determines that
13 products which do not comply with the UL standard for those
14 products do not comply with the UL standard for those
15 products are substantial product hazards and can take
16 enforcement action against the manufacturers.

17 An example of that is your typical extension cords
18 that you buy with the multiple plugs on one end and the
19 single plug on the other end. Those products, if they do
20 not comply with the requirements of the safety standard for
21 extension cords, are determined to be substantial product
22 hazard and CPSC, in many cases, forces the manufacturers and
23 the distributors to recall those products from the U.S.
24 marketplace.

25 In addition, there are several states that require

1 third-party certification and compliance with our standards
2 for sale in the marketplace. I believe Maryland is one of
3 those states, as well.

4 MR. VARMA: I'm just interested in the garage door
5 example that you mentioned earlier. Had you adopted the
6 standards before the Congress elected the law about the
7 garage door opener safety feature?

8 MR. GELLERMAN: Yes.

9 MR. VARMA: Which one happened first?

10 MR. GELLERMAN: UL published the standard first
11 and Congress passed a law that referenced our standard as
12 being the requirement.

13 MR. VARMA: Were these manufacturers at that point
14 in time who were manufacturing the openers without that
15 safety device that prompted Congress to enact the law, or
16 was it basically --

17 MR. GELLERMAN: I think field incidents prompted
18 Congress to enact the law. Some young children were
19 severely injured or killed in garage door opener incidents.
20 That prompted us to initiate a standards action very quickly
21 to work with everybody who was involved in the standards
22 development process to find a set of requirements that could
23 provide a reasonable level of safety for garage door openers
24 and avoid those incidents from reoccurring. Shortly after
25 the requirements came out, the public law was enacted which

1 required that of garage door openers.

2 MR. VARMA: Okay. So other than this example, are
3 there any federal requirements for safety of electrical
4 appliances?

5 MR. GELLERMAN: The only federal requirements for
6 safety of electrical appliances currently in a mandatory
7 situation are the OSHA requirements that products used in
8 the workplace be certified by a nationally recognized
9 testing laboratory. The nationally recognized testing
10 laboratory program is an accreditation program for third-
11 party certification bodies. And for the most part, they
12 rely on UL standards as the basis for the requirements to
13 which those products are certified.

14 MR. VARMA: So in essence, federal requirements
15 are minimal?

16 MR. GELLERMAN: Federal requirements are minimal.
17 That is correct?

18 MR. VARMA: And why is that? I mean, how does the
19 marketplace operate with minimal federal requirements?

20 MR. GELLERMAN: Well, in my experience,
21 Underwriters Laboratories standards have been in place since
22 electrical appliances became popular in the homes. And we
23 have been conducting our operations, developing standards
24 for new products, providing certification for those products
25 as a demonstration of conformity. And that really has been

1 a self-regulating feature. There have not been a tremendous
2 number of incidents in the field. And usually when we see
3 federal regulations, they're driven by field incidents.

4 So if you have a marketplace of products that
5 comply with the reasonable safety standard, and that
6 compliance is demonstrated by products in the field, there's
7 really not a need for a federal regulation in those
8 circumstances.

9 MR. VARMA: Okay. Gordon, we had some discussion
10 this morning and this afternoon as well concerning Part 68
11 requirements and our certification process and the amount of
12 time that is needed to issue registration numbers to new
13 equipment and bringing new technology to the consumers in a
14 timely fashion. I was wondering if you might be able to
15 draw a parallel to that in the electric power industry side
16 for electrical appliances. That if there are some hazards
17 which have been identified or some features or
18 functionalities that compromise safety, is your process able
19 to react quickly to those identified hazards? And are you
20 able to do it in a timely manner?

21 MR. GELLERMAN: I think we need to look at it from
22 two aspects. We all need to remember that the process is
23 two parts. There's a standards development piece to this.
24 And developing a set of technical requirements in a standard
25 is different than what is required to bring the product to

1 the marketplace. How do you demonstrate conformity with the
2 requirements is a separate question from what are the
3 technical requirements, and are they update, and does the
4 pace of the technical standard move fast enough?

5 So really, the answer has to be given in two
6 parts. And we'll talk about the standards part first. I'll
7 give you specific examples -- is probably the best way.

8 In my experience before I took this job in
9 governmental affairs, I was a certification engineer. I
10 spent half of my career of 14 years doing certification,
11 doing power supplies for PCs, and the second half of it,
12 doing electromedical devices.

13 In the world of electromedical devices, we had
14 some experiences and FDA had some experiences, and we worked
15 together to share information, where young children were
16 being hurt with apnea monitors. There were some very
17 strange incidents.

18 We saw a way to modify the technical requirements
19 of the standard, which at that point in time was UL544, the
20 standard for medical and dental equipment, to eliminate the
21 possibility of those incidents. These incidents resulted in
22 death, for the most part. Not minor injuries, but death
23 usually of young children.

24 And there were, I think if I remember my history
25 correctly, about eight incidents in about a three-year span

1 of time. We became aware of the number of incidents and
2 what the focus was on.

3 Once that awareness was raised, we modified the
4 standard and implemented the new requirements as a
5 requirement to demonstrate conformity in about a three-month
6 cycle. I believe it took us a little bit longer to drive it
7 through the process to the point where the ANSI process was
8 satisfied.

9 But at that point in time, the requirements from
10 UL's perspective from looking at our mission of testing for
11 public safety, it was so important that those products be
12 brought into the standard. As a minimum set of requirements
13 for safety, we initiated kind of an emergency action and
14 used a process very expedient to change the standard. And
15 we did that about in three months. And I believe we
16 required that those requirements in the standard were
17 effective upon publication.

18 So it all happened very quickly. And you know,
19 those kinds of things depend greatly on the need and the
20 hazard and the level of the incidents involved. So that's
21 what happens from the standards development process. When
22 it needs to be fast, it can be very fast.

23 I think in a general rule when you're writing an
24 entire standard or when you're dealing with issues which
25 aren't as incident-driven, the process moves a little bit

1 slower. But that's to give everybody time in their normal
2 daily life to be a part of that consensus development
3 process and provide adequate input.

4 Now the other end of it is the certification
5 process. In the United States, the process of
6 certification, demonstration of conformity, is an open
7 marketplace. It's a very competitive open marketplace.
8 There are several representatives of other certifiers in the
9 room today. And like any other competitive process, we are
10 driven to provide high levels of customer service at
11 reasonable prices. So that in turn drives down the time it
12 takes from the date a manufacturer submits a product for
13 certification to the day we send them the letter indicating
14 that he does -- he has achieved that certification and can
15 bear the mark.

16 MR. VARMA: Okay. We also had some discussion
17 this morning about the Part 68 or anything that might be
18 similar to that requiring the force and effect of law. And
19 I realize that there are some similarities and some
20 dissimilarities between the electric power industry on the
21 one hand and the telecommunications industry on the other
22 hand. But I wanted to ask you if there is such a force and
23 effective law as far as the standard that UL is concerned.

24 MR. GELLERMAN: The question is, is there a
25 forceful and effective law?

1 MR. VARMA: Right.

2 MR. GELLERMAN: On a federal level in certain
3 circumstances, the answer is yes. In the garage door
4 example I gave you, it's an act of Congress. Certainly,
5 there's a force of law behind it. For products which are
6 destined for the workplace, OSHA's requirements have the
7 force of law.

8 Other than those two specific scenarios and maybe
9 a couple other that I'm not giving you offhand, the answer's
10 no, because in the United States, the process and the demand
11 drivers behind the process, the consumer demand, the
12 insurance interest demand, the local and state authorities
13 demand that products demonstrate their conformity with an
14 adequate safety standard before they're available in the
15 marketplace is strong enough without that force of law.

16 MR. VARMA: A very general question actually at
17 this point. Do you believe that there is an opportunity
18 here for us to use that model for telecommunications, CPE
19 under Part 68? Is there any opportunity here, even
20 recognizing the dissimilarities between the two industries?

21 MR. GELLERMAN: Well, I think certainly and again,
22 I think we need to look at the question in two parts. One
23 in the standards development part. How do the technical
24 requirements get developed? Do they get developed in 47
25 C.F.R., or do they get developed by private sector standards

1 development body under an ANSI-type process?

2 I think the answer to that is yes. I think we've
3 heard it almost resoundingly around the table that for maybe
4 all of, but certainly for parts of Part 68, there's an
5 opportunity to use an independent private sector SDO to
6 shepherd the process, maintain that open consensus forum,
7 development requirements in an expedient format.

8 I think the real question is, once that's done,
9 how is it going to be turned into a regulation if it's
10 necessary. And then, how much time delay is there going to
11 be between the time that the SDO publishes the requirements
12 and the time when FCC puts those requirements into force?
13 Is that going to go through a long process of evaluation by
14 FCC and then a long drawn out public comment process, or are
15 we going to have an expedient process, as Chuck suggested?

16 One of the things I think that hasn't really been
17 seen here is that I would anticipate the process would have
18 significant FCC participation. And most of the people
19 around the table in the standards development forum I think
20 would have the understanding that FCC had to buy into the
21 level of technical requirements that were being proposed in
22 order for them to flow smoothly through the process of
23 turning into a regulation.

24 One of the pitfalls that we've seen with other
25 regulations that have referenced standards, whether they be

1 UL standards or anybody's standards is that the regulatory
2 bodies tend to reference a specific addition or date of a
3 standard. And what often happens is that the private sector
4 standards development process moves ahead because technology
5 changes, the products change, more hazards are identified.
6 And oftentimes the updating of the regulations to point to
7 the newest version of the standard is far delayed.

8 I think we heard several instances where things
9 are years behind, both from FCC perspective with some of the
10 private sector standards, as well as -- I think some people
11 mentioned how far behind some of the local jurisdictions
12 were in updating their enforcement of the National
13 Electrical Code, which is another private sector standard.

14 MR. VARMA: Do you have anything else to add in
15 general comments or anything?

16 MR. GELLERMAN: The only general comment I have is
17 I think we all need to have an understanding when it comes
18 to what's required for market entry. And this isn't about
19 the technical requirements now. This is about what we refer
20 to as how do you demonstrate conformity?

21 I think we've heard several things here. We've
22 heard suppliers declaration, both with and without use of an
23 accredited laboratory. We've heard a little bit about
24 certification as you know it, maybe from a UL perspective
25 where we would investigate a product to determine that it

1 complies. Initiate some kind of a surveillance to make sure
2 the manufacturer kept churning out that same compliant
3 product over and over again.

4 I think what we all really need to understand is
5 that the decision on what type of conformity is necessary
6 for the marketplace should be driven by several things. One
7 is the hazard associated with the product. I don't think
8 anybody would want an implanted pacemaker to be free from a
9 regulatory premarket process. The hazard is great. So we
10 wouldn't want a system that allows a manufacturer to go to
11 the marketplace without a significant check on what he's
12 introducing to the marketplace to make sure people don't get
13 hurt.

14 One of the problems is, is once those products are
15 in the marketplace, recalls, while you can make them, they
16 aren't a 100 percent effective. And once a pacemaker, for
17 instance, is implanted, a recall isn't the pleasant
18 alternative.

19 So depending -- I'm using this as an example on
20 one end of the scale. On the other end of the scale, there
21 are some products that are significantly lower levels of
22 hazards. In those cases, maybe the other end of the
23 spectrum is appropriate.

24 But I think the two factors -- the depth of the
25 hazard and the incidents which the product could be involved

1 in is one factor. And the second factor is the confidence
2 needs of the regulators and the marketplace in whole need to
3 be taken into account when we determine what mechanisms are
4 necessary for market entry, whether those be suppliers
5 declarations, suppliers declarations with an accredited
6 laboratories testing behind it, or a real certification from
7 a third party.

8 That's all the comments, and does anybody have any
9 other questions?

10 MR. VARMA: Okay. Thanks very much.

11 MR. GELLERMAN: Thank you.

12 MR. SCHROEDER: Thank you. Well, we'll open it up
13 for a freer flowing discussion now that the opening
14 statements are completed.

15 Yes, Mr. Wagner?

16 MR. WAGNER: John Wagner from Lucent Technologies.
17 I'd just like to add or maybe clarify one of the comments
18 that was made. It's true that Underwriters will act as a
19 standards development organization and end up having a
20 standard which ultimately may become an ANSI standard.

21 But in the case of the prompt action that they
22 took in order to correct, I believe it was the garage door
23 thing, I think it was mentioned, Underwriters, because of
24 their dual function, as both a standards body and a "listing
25 agency" has the ability to independent of the ANSI process,

1 to say, "We, as a nurtle (phonetic), may modify our own
2 standard as we see fit independent of the ANSI standard
3 itself. So if you choose to list your product through us,
4 effective this afternoon, we are invoking a new requirement
5 that exists only within our organization."

6 The ANSI document may well take several months to,
7 or perhaps even longer, to follow suit. So it's a little
8 bit different than the SDO having the ability to react
9 almost instantly, because in that case, it would have to go
10 through this typical review process.

11 MR. SCHROEDER: Thank you. Mr. Hurst?

12 MR. HURST: Yes. William Hurst from CCL. Just to
13 follow up a little bit on some of the comments from Gordon,
14 as we look at I think the process that we would like to see,
15 that is, a very open ability through an SDO to evaluate all
16 of the concerns from the entire industry, as we look at a
17 particular UL model, I mean, we're talking about a private
18 organization now that is doing this. And so, they're driven
19 by a number of things.

20 We would very much like to see this an open system
21 through -- one of the organizations had been noted, either
22 TIA or the T(1) E(1) groups. We feel it's important that
23 all of the players have the opportunity to participate. And
24 within the ANSI methods of developing standards, there are
25 different methods. We want to make certain that the most

1 open method is used that we do have a true consensus of the
2 entire industry. And so, we want to make certain that it is
3 a very open process in developing that standard.

4 And so, I believe that the UL example does lend
5 itself fairly well to a standard development organization
6 developing standards. And then we can use those standards
7 by pointing to them within the Part 68.

8 MR. SCHROEDER: Thank you. I guess I'll open it
9 up for questions from our FCC panel. Yog, would you like to
10 start?

11 MR. VARMA: Yes. I have a couple of questions for
12 Clint.

13 Clint, you mentioned that it takes about six
14 months for a product to be developed. And out of that about
15 five to six weeks, I believe, is what you said is consumed
16 by the certification process. And you suggested as an
17 alternative the declaration of conformity to expedite the
18 process and to sort of do away with our Part 68
19 certification process, so to speak.

20 I was wondering if you might be able to explain a
21 little bit more as to how much time you save by the rule of
22 declaration of conformity, and who makes the measurements?
23 Who does the testing? And at what point in time are those
24 tests performed?

25 MR. PINKHAM: Okay. Well, to start with the

Heritage Reporting Corporation
(202) 628-4888

1 explanation of the timing involved, under the existing
2 certification system, as I mentioned, products are prepared,
3 sent to a test lab. It takes a test lab a finite amount of
4 time to make the measurements and prepare the report, which
5 is sent to the FCC. And the total time from sending the
6 product to the test lab until that point where we receive
7 the registration number and can actually start production or
8 start production, those stickers that we're putting on
9 product that we will make, is about five to six weeks
10 typically.

11 In the declaration of conformity, essentially, we
12 would still have to prepare the product. We would still
13 have to make those measurements. But as soon as the
14 measurements were made and we're positive, we could go ahead
15 with production.

16 So basically we'd be cutting out around three to
17 four weeks nominally from the process. Perhaps more because
18 -- and, I may be saying something I shouldn't here. But it
19 is not uncommon to start production on a risk basis. By
20 that, I mean if a product's really hot and you need it right
21 now, you can go ahead and build a certain amount of product,
22 and betting on the come, it will. Generally, you know
23 pretty much beforehand whether or not it will meet the
24 standards.

25 If you're very confident that it will meet

Heritage Reporting Corporation
(202) 628-4888

1 standards, you can go ahead with production at the same time
2 you start the regulatory process or the conformity process.
3 You can't do that with the existing system because you have
4 to wait for that number. So the time, typically, I'm
5 saying, would be three to four weeks. But it could be as
6 much as five as six, depending on how much risk you're
7 willing to take.

8 MR. VARMA: Okay. So in essence, you are able to
9 reduce the total amount of time by the amount of time we
10 take for the certification process and for the issues of the
11 registration number?

12 MR. PINKHAM: Basically, yes. There's always a
13 whole lot of things going on in parallel. And obviously,
14 you can't take one and eliminate it and say, "If I can get
15 rid of this five-week piece, then I can save the entire five
16 weeks." Maybe you can save only two or three or four or
17 five. But there is a considerable amount of time in there.
18 In my estimate for Thomson at least, it is in the three-to-
19 four-week category.

20 MR. VARMA: But other than that, I take it that
21 you would be conducting all the tests that are otherwise
22 required. And you would perhaps maintain all the underlying
23 data before you prepare and issue a declaration of
24 conformity?

25 MR. PINKHAM: That's true. That's part of the

1 declaration of conformity process as defined in 48 C.F.R.

2 Part 2. And even though my personal believe is a for a free
3 market unhampered by any regulation, I'm tempered on this
4 one by Thomson's position. And that's slightly different.

5 We are a major manufacturer. We manufacture 20
6 million products a year. And we plan to be in it for the
7 long haul. So we have to be on the side of the angels. We
8 can't put garbage out there because our customers won't have
9 it. We can't put stuff out there that hurts the network
10 because eventually it'll get back to us and it'll hurt us.

11 But we compete with other people that aren't
12 necessarily constrained as much as we are. There's a lot of
13 fly-by-nighters out there. And we feel that not only are
14 there some fly by nighters, there's a lot of people out
15 there who want to be on the good guys' side, but just don't
16 have the technical know-how to do it. And if there is a
17 requirement that measurements must be made by an accredited
18 laboratory, then that laboratory will keep the vast majority
19 of the marginal participants on the side of the angels.

20 There's always going to be that guy who goes out
21 there and hires some guy in a white coat to put his name on
22 some piece of paper and claim he's an accredited laboratory
23 when he's not and produce garbage. Go in, make his profit
24 and run. You're not going to protect against him with any
25 kind of laws.

1 But those people who want to do the right thing,
2 if they are faced with having measurements made by an
3 accredited laboratory will normally take the advice of that
4 laboratory and produce a product that does meet the
5 standards. So we feel that the measurements by an
6 accredited laboratory is kind of a safety net for those of
7 us who like to feel we're on the side of the angels.

8 MR. VARMA: And Clint, I take it that there will
9 be some language or some other phrase that will appear on
10 the instrument in lieu of the registration number such as
11 that it conforms to the requirements and so on?

12 MR. PINKHAM: I believe that's defined in Part 2.
13 It would be the same procedure that's currently used for
14 information technology equipment, computers and so forth.

15 MR. VARMA: Okay. Okay, thank you. I have some
16 questions for Chuck.

17 Chuck, one of your recommendations was that the
18 core technical work should be deferred to the SDOs, similar
19 to what is done in Canada? And you described how this
20 process is open to all the parties and how negative comments
21 have to be responded to and those kind of things.

22 Development of standard is one thing. And
23 certification of equipment that conforms with the standards
24 is another. I was not clear if you made some
25 recommendations as to the certification process, as well.

1 So even as we defer, do SDOs for the development of
2 standards, et cetera, what would you envision as for the
3 FCC's current registration program yourself is concerned?

4 MR. BERESTECKY: Let me say I did not intend in
5 any way to address the conformity assessment aspect in my
6 presentation. My presentation dealt with how are the
7 technical requirements to be developed under this new
8 paradigm? So I was recommending how that might be done in
9 this very open process.

10 MR. VARMA: Okay.

11 MR. BERESTECKY: Threw some suggestions out there,
12 and I'm sure there are other ways we're going to modify
13 that. I was not in any way talking about in conformity
14 assessment because I thought that was the topic for
15 tomorrow. And I just want to make that clear.

16 Now, if you want to ask me what I think about the
17 conformity assessment registration, I would prefer -- I'd
18 like to have that spoke to by the TIA spokesperson. But we
19 are interested in moving it away from certification to a
20 supplier declaring their own conformity.

21 Now, when you get into the issue of whether we
22 want lab or lab accreditation or no lab accreditation, but I
23 think that that's an issue that we need to discuss tomorrow
24 because I think that is the big issue there. In my view, we
25 today have basically a system where we send it to the labs

1 or we get a product approved to a set of test procedures
2 that's on the file with the Commission. The tester is not
3 accredited in any way.

4 My own take is that you can do the same thing
5 using the verification route, which is all defined in Part 2
6 of the Rules with the test procedures on file with some
7 central entity. And I don't know what that is at this time.
8 And that the manufacturer would test two requirements or
9 test procedures that they have on file, and that they would
10 build their own documentation file that is available under
11 enforcement by the Commission if they find that there is an
12 issue of noncompliance. And I believe that is no less than
13 what you have today, because today the labs are not
14 accredited under the current scheme.

15 I mean, I wasn't prepared to speak to that, but
16 I'm just giving you again my own personal view as to how I
17 would approach that.

18 MR. VARMA: Okay, thanks, Chuck. Going back for a
19 moment to the development of standards and ANSI and SDO, the
20 comment cycle and those kinds of things, once they come up
21 with those standards, whose standards are they going to be?
22 Are they going to be their standards or our standards?
23 Whose rules are they going to be?

24 MR. BERESTECKY: Okay. That is why I made the
25 comment there that once the SDO has completed its work, and

1 this is on the assumption that the SDO has been delegated
2 the authority to develop technical requirements. And I'm
3 going to use the word "technical requirements" when I talk
4 about mandatory. I'm going to use the word "standards" when
5 I'm talking about voluntary.

6 These are intended to be technical requirements
7 that the SDO is developing. And when they go through the
8 development cycle, we would expect that they would be
9 codified or recognized by the Commission. And when they
10 become recognized by the Commission, I could see that being
11 what is in your one-page C.F.R. Part 68 that says, "Here is
12 the pointer to where the requirements are. It's in this
13 ANSI SDOs documentation." That's the concept that I have in
14 mind that I was trying to put forth here.

15 And you can really open the process up more to be
16 sure that it covers the world out there. When the SDO has
17 completed its works and its ready to go out for ballot,
18 which is under the ANSI process a 60-day ballot, we would
19 ask and even prepare for the Commission, the SDO would, a
20 public notice would go out announcing that we are doing this
21 so that the public would have an opportunity besides all
22 those who know about it ANSI of reviewing what we're doing.

23 And they could go right through the ballot process
24 with us. It would, in effect, become a C.F.R. Part 68. It
25 would not be the SDOs requirements except by the pointer.

1 It would be a mandatory requirement endorsed by the
2 Commission. But we would expect FCC participation in our
3 committees so that we are heading in the right direction.

4 We did that under -- when we did the harmonized
5 document. We had a very good record with that. We did the
6 harmonized document. We put it out. We brought in a group
7 of people to discuss it in an open forum. Then we presented
8 it to the Commission. There were no objections to it. So
9 we do have history of doing it.

10 And I think that -- and, I'm talking about my
11 committee, but we also have T(1) E(1) who is doing it. I
12 believe it can be done, but it should be done under an
13 accredited SDO.

14 I'm sorry if that was a little long-winded, but I
15 wanted to --

16 MR. VARMA: No, I appreciate that, actually. But
17 Chuck, I still have one concern, which is that the SDOs
18 under the auspices of the FCC uses a public process, invites
19 comments, responds to negative comments, and a method goes a
20 step beyond that by asking the party that, "Look, we
21 responded to your negative comment. Are you satisfied with
22 the resolution?" I think is a very open public process?

23 MR. BERESTECKY: Yes.

24 MR. VARMA: But then, it appears to me that the
25 FCC goes through a second redundant comment cycle, so to

1 speak. And I can see why you wish to have that process and
2 sequence.

3 I was wondering if there is any possibility at all
4 that you can suggest so that to the degree there is any
5 redundancy at all, we might be able to do away with that.

6 MR. BERESTECKY: We would love to find a way to do
7 away, but that's why we wrote the comments the way we did,
8 and we're hoping to get other suggestions within this group.
9 But one of the things -- one of the suggestions I just made
10 here, which is not in the TIA comments was that when you go
11 to the ballot process, the public notice put out by the FCC
12 would give us the opportunity to have the open process with
13 the people that would look at your notice to participate in
14 the SDO with their ballots.

15 When we would come to you with our recommendation,
16 you could either because of your participation in it or by
17 looking at the record, if you have to use the Administrative
18 Procedures Act, put it out for comment with a very short
19 cycle, two weeks. If at the end of the two weeks, you have
20 no comments or the comments are no different than what
21 you've seen that's already been managed, it becomes the
22 rules.

23 In other words, expedite the Administrative
24 Procedures Act if it has to be used. We're not trying to
25 circumvent it. I'm asking you, actually. Since you have to
